

Graider

District Onboarding Guide

How district admins, school admins, teachers, and students get set up — and exactly how to fill in every field on the configuration page.

Prepared for district technology leadership
Setup time: about 30 minutes for a district admin

1. The big picture

Graider is an AI grading and assessment assistant for teachers. Before teachers and students can sign in, one person at the district — the **district admin** — spends about half an hour on a single setup page to connect your student information system (SIS) and turn on the AI. After that, everyone else is onboarded automatically through the single sign-on (SSO) your district already uses.

The four roles

District Admin	Usually you or someone on the IT team. Connects the SIS, enters the AI keys, and decides who else gets admin access. Works on the /district page. This is the only role that touches configuration.
School Admin (Principal)	A teacher or principal who can see school-wide results for their building. Gets access two ways: an invite code from the district admin, or by being named on the SSO admin list. They do <i>not</i> configure anything technical.
Teacher	Signs in with your district SSO (Clever or ClassLink) or with a Graider email account. Their classes and students appear automatically from the roster. They create assignments and grade.
Student	Signs in with district SSO, or joins a single assignment with a 6-character class code — no account required for the quick-code path.

The order things happen

- 1 District admin sets up Graider** on the /district page (SIS + AI keys). ~30 minutes, once.
- 2 Graider enables your SSO** (Clever or ClassLink) using the credentials you provide. This is a quick coordination step with the Graider team.
- 3 Teachers sign in** through your SSO portal. Their rosters sync automatically — no manual class building.
- 4 Students sign in** through the same SSO, or use a class code for a one-off assignment.
- 5 School admins are granted access** by the district admin whenever you want school-level reporting.

What the district provides vs. what Graider does

You provide: SIS API credentials, your AI provider keys (or use Graider's), and your SSO app credentials. Graider does: the SSO wiring on our servers, hosting, security, and the grading engine. Nothing is installed on district hardware — Graider is a hosted web app at app.graider.live.

2. District admin onboarding

The district admin is the first person to set up Graider. Everything happens at one URL.

Step 1 — Open the configuration page

Go to <https://app.graider.live/district> in any browser. There is nothing to install.

Step 2 — Create the district admin password (first time only)

The very first time anyone opens /district, Graider asks you to create a district admin password. This password protects the configuration page — it is separate from any teacher or SSO login.

Field	What to enter	Where to find it / notes
Password	A strong password, at least 8 characters. Store it in your IT password manager.	You choose it. This is the key to the whole district configuration, so treat it like an admin credential.
Confirm Password	Type the same password again.	Must match exactly.

After setup, this screen becomes a login

On every later visit, /district shows a single password box. Enter the password you created to reach the configuration. You can change it later from the “Change Password” control at the bottom of the page.

Step 3 — Choose your SIS provider

At the top of the page, under **SIS Provider**, pick the system that holds your rosters by selecting one of the two radio buttons: **Clever** or **OneRoster**. The fields below change to match your choice. (If your district uses ClassLink, see the note at the end of this section.)

Step 3a — Fill in the Clever fields

Choose this if your district uses Clever for rostering and/or single sign-on. All values come from your Clever district dashboard (schools.clever.com → your Graider application).

Field	What to enter	Where to find it / notes
Client ID	Your Clever application's OAuth Client ID.	Clever dashboard → Applications → Graider → <i>OAuth Credentials</i> .
Client Secret	Your Clever application's OAuth Client Secret.	Same screen as the Client ID. Keep it secret; it is write-only here and shows a "Saved" badge once stored.
Redirect URI	Leave the pre-filled value: <code>https://app.graider.live/api/clever/callback</code>	Must match the redirect URL registered in your Clever app exactly. Only change it if Graider tells you to.
District Token (optional)	Your Clever Secure Sync district token, if you use Secure Sync.	Clever dashboard → Secure Sync. Optional — leave blank if you are not using Secure Sync.

Step 3b — Fill in the OneRoster fields

Choose this if your SIS exposes a OneRoster 1.1 API (PowerSchool, Infinite Campus, Skyward, and many others). Values come from your SIS's OneRoster / API credentials screen.

Field	What to enter	Where to find it / notes
Base URL	The root of your OneRoster API, e.g. <code>https://sis.district.org/ims/oneroster/v1p1</code>	Your SIS's OneRoster endpoint. Your SIS vendor or its API documentation provides this.
Client ID	The OAuth 2.0 client ID issued by your SIS.	SIS admin → API / OneRoster credentials. Often called "consumer key."
Client Secret	The OAuth 2.0 client secret issued by your SIS.	Same screen. Often called "consumer secret." Stored write-only.
Token URL (optional)	The OAuth token endpoint, if your SIS uses a non-standard one.	Leave blank to let Graider auto-detect (<code>{Base URL}/token</code>). Fill only if your vendor specifies a different token URL.
School ID (optional)	A single school's <i>sourcedId</i> to limit the roster to one building.	Leave blank to sync the whole district. Use a school <i>sourcedId</i> from your SIS to scope a pilot.

Step 3c — Test, then save

- Click **Test Connection**. Graider contacts your SIS and confirms the credentials work. You'll see "Connection successful" or a clear error.
- Click **Save SIS Config**. A green **Saved** badge confirms it is stored.

Using ClassLink for SSO?

ClassLink single sign-on is wired up on Graider's side using ClassLink app credentials you provide to the Graider team (it is not entered on this page). Roster data can still come from ClassLink's OneRoster API — enter those API credentials in the OneRoster fields above. Coordinate the ClassLink SSO tile with Graider support.

Step 4 — Enter the AI API keys

Under **AI API Keys**, provide at least one AI provider key so Graider can grade. You can enter one, two, or all three. Teachers may optionally override these with their own keys in their personal Settings.

Field	What to enter	Where to find it / notes
OpenAI API Key	A key starting with sk -	platform.openai.com → API keys. Powers GPT-based grading.
Anthropic API Key	A key starting with sk -ant -	console.anthropic.com → API keys. Powers Claude-based grading.
Gemini API Key	A key starting with AIza	Google AI Studio → API keys. Powers Gemini-based grading.

- Each saved key shows a **Saved** badge. To keep an existing key, leave the box blank — typing replaces it.
- Click **Save Keys** when done.

Which key should we use?

Any one is enough to start. Districts commonly provide an OpenAI or Anthropic key. If you'd rather not manage AI billing, ask Graider about using Graider-managed keys instead — then you can leave all three blank.

Step 5 — Decide who else gets admin access

Two sections near the bottom of the page let you grant access to others. Use whichever fits how that person signs in.

Option A — School Admins (invite by code)

Use this to make a principal or lead teacher a **school admin** who can see school-wide results. Graider generates a code they redeem inside the teacher app.

Field	What to enter	Where to find it / notes
School Name	The building this admin oversees, e.g. "Lincoln Middle School."	You type it. Appears on their dashboard.
Pre-assign Teachers (optional)	Start typing a teacher's name to attach them to this school.	Optional. Helps group teachers under the right building.

Click to generate an **invite code**. Send that code to the principal; they enter it in the teacher app's **Admin** tab to claim access. Codes expire, so send them promptly. Existing admins appear in a table where you can **Revoke** access at any time.

Option B — SSO Admin Access (designate by email)

Use this when admins sign in through SSO. You name their email in advance; the moment they sign in through Clever or ClassLink, they receive the admin level you chose. Graider never grants admin from the identity provider alone — the email must be on this list.

Field	What to enter	Where to find it / notes
Email	The exact email the person uses to sign in via SSO.	Must match their SSO email. e.g. principal@district.org
Access Level	Pick District Admin (full configuration access) or School Admin (one building's reporting).	Dropdown.
School	The building name — shown only when Access Level is School Admin .	Type the school this admin oversees.

District Admin vs. School Admin — what's the difference?

A **District Admin** can open /district and change configuration, plus see district-wide analytics. A **School Admin** cannot change configuration — they get a read-only, school-scoped results dashboard inside the teacher app. Grant District Admin sparingly.

Step 6 — Review the Configuration Summary

The **Configuration Summary** at the bottom lists what is connected (SIS provider, which AI keys are set, admin counts) so you can confirm everything at a glance before you finish. Use **Change Password** here if you ever need to rotate the district admin password.

3. School admin (principal) onboarding

School admins get a read-only, school-wide view of teacher activity and results. They never configure anything. There are two ways to onboard one — the district admin chooses based on how the person signs in.

Path 1 — Invite code

- 1 District admin generates an invite code in the **School Admins** section of /district (Step 5, Option A).
- 2 Principal signs in to Graider as a normal teacher (SSO or email).
- 3 Principal opens the **Admin** tab in the teacher app and enters the code.
- 4 Access is granted immediately; the school dashboard appears.

Path 2 — SSO designation

- 1 District admin adds the principal's email under **SSO Admin Access** with level **School Admin** and the school name (Step 5, Option B).
- 2 Principal signs in through your district SSO.
- 3 Graider matches their email to the designation and grants school admin access automatically — no code needed.

What a school admin sees

School-wide totals (teachers, students, assessments, average score), a grade distribution, and a per-teacher activity list — all limited to their building. It is reporting only; they cannot change grades or settings.

4. Teacher onboarding

Teachers do not need any setup from IT beyond having a roster in your SIS and SSO turned on. They onboard themselves the first time they sign in.

How a teacher signs in

- **District SSO (recommended):** The teacher clicks your Clever or ClassLink tile, or the SSO button on Graider's login screen. They are recognized as a teacher and land in their dashboard.
- **Email account:** Teachers can also sign up with an email and password directly, useful for pilots before SSO is live.

What happens automatically

- Their **classes and students sync from the roster** — no manual class building.
- Accommodations (IEP / 504 / ELL) flagged in your SIS can be applied so grading respects them.
- They can immediately create assignments, publish them, and grade with AI.

OneRoster teacher matching

When rosters come from OneRoster, a teacher may be asked once to confirm their identity (their OneRoster sourcedId) so Graider attaches the right classes. This is a one-time, self-service step.

5. Student onboarding

Students have the lightest path. Choose whichever fits the activity — both can coexist.

Path 1 — Single sign-on (recommended for class work)

- The student clicks your Clever or ClassLink tile (or the SSO button on the student login screen).
- They land in their student portal at **/student** with their assigned work already listed — no account creation, no passwords to manage.
- Submissions are tied to their roster identity, so results flow to the right teacher and school.

Path 2 — Class code (recommended for quick or one-off assignments)

- The teacher publishes an assignment and shares a **6-character class code**.
- The student goes to **app.graider.live/join/CODE** (or types the code), completes the assignment, and submits — no account required.
- Great for substitutes, make-up work, or districts not yet on SSO.

Path 3 — Email + class code (authenticated, no SSO)

Students can also log in with their email and a class code when a teacher wants authenticated submissions but the district isn't using SSO. This keeps work tied to a named student without requiring the SIS roster.

6. Data privacy & offboarding

- **What syncs:** names, email/identifiers, class enrollment, and — if present — accommodation flags. Graider pulls only what it needs to roster and grade.
- **Where it lives:** Graider is hosted (app.graider.live). No district servers or installs are involved.
- **Credentials are write-only:** once saved, secrets and AI keys are never displayed back — the page only shows a “Saved” badge.
- **FERPA right-to-delete:** the district admin can delete all SIS-sourced data (Clever, ClassLink, or OneRoster) from the relevant integration controls. Removal is district-initiated and auditable.
- **Revoking access:** revoke a school admin from the admins table, or remove an SSO designation, at any time. Disabling a user in your SIS/SSO stops their access at the next sign-in.

One-page summary for the CTO

Connect your SIS (Clever or OneRoster) on **/district**, add one AI key, and decide who gets admin. Coordinate the SSO tile with Graider. After that, teachers and students sign in with the SSO you already have, rosters sync themselves, and you can pull school- or district-wide reporting whenever you want. Total district-admin effort: about 30 minutes.

Questions during setup? Contact Graider support. This guide reflects the **/district** configuration page and onboarding flows as currently shipped.
